

Sales Performance Analysis Summary

1. Data Cleaning Steps:

- Removed duplicate records from the dataset
 - Handled missing values in the amount column using median values
 - Standardized inconsistent stage names (e.g., Closed Won, Closed Lost)
 - Converted date column into proper datetime format
 - Mapped categorical values (sales representatives and products) into structured IDs
-

2. Data Structuring:

- Created three relational tables: sales_data, sales_reps, and products
 - Established relationships using sales_rep_id and product_id
 - Ensured consistency for SQL-based analysis
-

3. SQL Analysis Performed:

- Calculated total revenue, total deals, average deal size, and win rate
 - Analyzed region-wise sales performance using joins
 - Identified top 10 sales representatives based on revenue and closed deals
 - Evaluated conversion rates across different sales stages
 - Assessed product-wise performance
-

4. Reporting & Visualization:

- Created a structured dashboard using Google Sheets
 - Included summary metrics, regional analysis, top performers, and stage-wise funnel
 - Used charts such as bar graphs and pie charts for better visualization
-

5. Key Insights:

- Revenue is concentrated among a few top-performing sales representatives
 - Certain regions outperform others significantly in terms of revenue
 - Conversion rates drop in intermediate sales stages
 - Product performance varies across categories
-

Conclusion:

This analysis provides insights into sales performance and highlights opportunities to improve conversion rates, regional strategies, and overall business efficiency.
